Breeding Soundness Report

Veterinary examination… to be submitted before any semen is shipped

Mare's name_____ Breed_____

Owner's name_____

PHYSICAL EXAMINATION (to be completed by veterinarian):
Basic conformation should be considered to determine if the mare is sound enough to withstand the act of breeding and that she will not pass on any SEVERE conformational abnormalities. Pelvic injuries or abnormalities may pose foaling problems. Teeth should also be examined to detect over- and under- shot jaws. The mare owner should strongly consider not breeding mares with these conditions.

Please review the above breeding history and note any conformational abnormalities:
_____
_____
_____
_____

RECTAL AND/OR VAGINAL EXAMINATION:
(If mare is in foal, please examine the mare AFTER foaling. This form must be submitted before any semen will be shipped and preferable please submit it with the contract)
In determining the breeding soundness of a mare, these examinations may not be required. The type and number of examinations will depend on the reason for the examination, stage of cycle, status or reproductive tract and individual examiner.

I have examined the above named mare, while she was in estrus, and found her to be in sound breeding condition. There is no indication that she would be unable to conceive or carry a foal to term.
